

Lean Workflow

Hospital Appointment Reminder and Scheduling System

Step 1: Lean Workflow

Feature: Appointment reminders

Major activities to deliver the feature:

1. Meet receptionists and patients to understand reminder needs
2. Write the user story and acceptance criteria
3. Design the reminder message and timing
4. Set up the SMS/email service
5. Build the scheduler that sends reminders automatically
6. Write documentation of every meeting and design decision
7. Test that reminders send on time to the right patient
8. Hold a review meeting with the team
9. Demo to users and collect feedback
10. Fix bugs and improve based on feedback
11. Deploy the feature
12. Wait for approval from every team member before starting each next task

Step 2: Classification of each activity

Customer value

Activities

1. Meet receptionist and patients
2. Design reminder message and timing
1. Build the scheduler
2. Demo and collect feedback
3. Fix bugs and improve
4. Deploy the feature

Reasons

1. Ensures the right thing is built
2. Directly effects how useful reminders are

3. This is the feature itself
4. Confirms the feature solves the problem
5. Improves what patients receive
6. Patients only benefit once it is live

Necessary support

Activities

1. Write user story and acceptance criteria
2. Set up SMS/email service
3. Test reminders
4. Review meeting

Reasons

1. Guides the team but users don't see it
2. Needed for the feature to work
3. Prevent errors reaching patients
4. Keeps quality and alignment

Waste

Activities

1. Write documentation of every detail
2. Wait for approval from everyone

Reasons

1. Heavy documentation nobody reads
2. Waiting delays delivery

Step 3: Kanban Workflow

Backlog	Ready	Doing	Testing	Review	Done
Reminder frequency options	Design reminder message	Build the scheduler	Testing reminder timing	Team review of scheduler	Write user story

Reminder in
local language

Set up
SMS/email
service

Test correct
patient receives
it

Meet
receptionists
and patients

Activities to eliminate

1. Heavy documentation of every detail - writing long documents for every decision slows the team down without adding real value
2. Waiting for approval from every team member - requiring the whole group to sign off before any task can start causes unnecessary delays.

Activities to improve

1. Manually testing every reminder scenario - checking each reminder case by hand takes time and is easy to get wrong. Automating these tests lets the team run them quickly every time the code changes, catching errors faster.

How removing those activities improves efficiency

1. Less documentation frees up time for actual building and testing. Short focused notes are easier to keep accurate, since long documents tend to go outdated and get ignored.
2. No waiting for full team approval keeps work moving. With free handoffs, tasks finish faster and the team gets feedback sooner instead of losing days to approval delays.
